

Accessories for forklift and pedestrian safety.

Blue Point LED Spot Light

The Blue Point LED Spot Light has earned prominence as a warning device with safety managers and operators alike. It projects a highly visible blue spot on the floor in front of or behind the forklift to alert both Pedestrians and other operators of oncoming forklift traffic. This visual early warning signal can be beneficial in loud work environments. Additionally the same highly visible LED spot light is also available in red for applications where the blue light may not be as visible due to lighting and floor surfaces.

Collision Sentry[™]

Collision Sentry[™] stands watch over “blind corner” intersections sending a warning to pedestrians and forklift drivers. When motion is detected on both sides of a corner, Collision Sentry works like a traffic light to send a visual signal that warns approaching traffic of a possible collision. Visible LED lights flash when a collision is imminent.

Collision Sentry includes integrated magnet mounts for easy installation on racking. It’s compact, visible, reliable and powered by standard D cell batteries so no wiring is required.

Digital Camera System

This economical and ergonomic solution can enhance the operator’s experience and performance as it adds to their range of visibility and it’s ideal for operator assistance when driving in reverse. This camera system utilizes a unique monitor and camera design including a 5.6” high-resolution touch screen color monitor and color infrared camera which delivers excellent picture quality even in low-light conditions. And it’s expandable up to 4 cameras.
